Rosuvastatin (marketed by [AstraZeneca](#) as Crestor) 10 mg tablets

**Rosuvastatin**, marketed as **Crestor**, is a member of the [drug](#) class of [statins](#), used in combination with exercise, diet, and weight-loss to treat [high cholesterol](#) and related conditions, and to prevent [cardiovascular disease](#). It was developed by [Shionogi](#). Crestor is the fourth-highest selling drug in the United States, accounting for approx. \$5.2 billion in sales in 2013.<sup>[2]</sup>

## Medical uses [edit]

The primary use of rosuvastatin is for the treatment of [dyslipidemia](#).<sup>[3]</sup> It is recommended to be used only after other measures such as diet, exercise, and weight reduction have not improved cholesterol levels.<sup>[3]</sup>

## Side effects and contraindications [edit]

Side effects are uncommon. The following side effects should be reported to the prescribing doctor if they persist or get worse:<sup>[4]</sup>

- [constipation](#)
- [heartburn](#)
- [dizziness](#)
- [insomnia](#)

- [depression](#)
- [joint pain](#)
- [cough](#)
- [memory loss](#) or [forgetfulness](#)
- [confusion](#)

The following rare side effects are more serious. Like all statins, rosuvastatin can possibly cause [myopathy](#), [rhabdomyolysis](#). Stop taking rosuvastatin and contact the prescribing doctor if any of these occur.<sup>[4][5]</sup>

- muscle pain, tenderness, or weakness
- lack of energy
- [fever](#)
- [chest pain](#)
- [jaundice](#): yellowing of the skin or eyes
- dark colored, or foamy urine
- pain in the upper right part of the abdomen
- [nausea](#)
- extreme tiredness
- weakness
- unusual bleeding or bruising
- loss of appetite
- [flu-like symptoms](#)
- [sore throat](#), [chills](#), or other signs of [infection](#)

If any signs of an allergic reaction develop, contact an emergency medical service immediately:<sup>[5]</sup>

- [rash](#)
- [hives](#)
- [itching](#)
- difficulty [breathing](#) or [swallowing](#)
- swelling of the face, throat, tongue, lips, eyes, hands, feet, ankles, or lower legs
- [hoarseness](#)
- [numbness](#) or [tingling](#) in fingers or toes

Rosuvastatin has multiple [contraindications](#), conditions that warrant withholding treatment with rosuvastatin, including hypersensitivity to rosuvastatin or any component of the formulation, active liver disease, elevation of serum [transaminases](#), pregnancy, or breast-feeding.<sup>[6]</sup> Rosuvastatin must not be taken while pregnant as it can cause serious harm to the unborn baby.<sup>[5]</sup> In the case of breastfeeding, it is unknown whether rosuvastatin is passed through breastmilk, but due to the potential of disrupting the infant's lipid metabolism, patients should not breast feed while on rosuvastatin.<sup>[5][7]</sup>

## Drug interactions[edit]

The following drugs can have negative interactions with rosuvastatin and should be discussed with the prescribing doctor:<sup>[4]</sup>

- [Anticoagulants](#) ('blood thinners') can affect the removal of rosuvastatin, examples include: [warfarin](#) (Coumadin); [cimetidine](#) (Tagamet); [cyclosporine](#) (Neoral, Sandimmune); [ketoconazole](#) (Nizoral)
- Additional medications for high cholesterol such as [clofibrate](#) (Atromid-S), [fenofibrate](#) (Tricor), [gemfibrozil](#) (Lopid), and [niacin](#) (Niaspan, Niacor);
- Specific [HIV protease inhibitors](#) including [atazanavir](#) (Reyataz), taken with [ritonavir](#) (Norvir) and [lopinavir](#) and [ritonavir](#) (Kaletra); and [spironolactone](#) (Aldactone).

- Alcohol intake should be reduced while on rosuvastatin in order to decrease risk of developing liver damage.<sup>[5]</sup>
- Aluminum and magnesium hydroxide antacids such as [Mylanta](#) and [Maalox](#), should not be taken within two hours of taking rosuvastatin<sup>[6]</sup>
- Coadministration of Rosuvastatin with [Eluxadoline](#) may increase the risk of Rhabdomyolysis and [myopathy](#) caused by the former.<sup>[8]</sup>

## Structure[edit]

---

Rosuvastatin has structural similarities with most other synthetic [statins](#), e.g., [atorvastatin](#), [cerivastatin](#) and [pitavastatin](#), but unlike other statins rosuvastatin contains [sulfur](#).

Crestor is actually rosuvastatin calcium,<sup>[9]</sup> in which calcium replaces the hydrogen in the [carboxylic acid](#) group on the right of the two structure diagrams.

## Mechanism of action[edit]

---

*Further information:* [Statin](#)

Rosuvastatin is a [competitive inhibitor](#) of the enzyme [HMG-CoA reductase](#), having a mechanism of action similar to that of other statins.<sup>[10]</sup> Its approximate elimination half life is 19 h and its time to peak plasma concentration is reached in 3–5 h following oral administration.<sup>[11]</sup>

Putative beneficial effects of rosuvastatin therapy on chronic heart failure may be negated by increases in collagen turnover markers as well as a reduction in plasma [coenzyme Q10](#) levels in patients with chronic heart failure.<sup>[12]</sup>

## Pharmacokinetics[edit]

---

Absolute [bioavailability](#) of rosuvastatin is about 20% and  $C_{max}$  is reached in 3 to 5 h; administration with food did not affect the [AUC](#). It is 88% [protein bound](#), mainly to [albumin](#).<sup>[13]</sup>

Rosuvastatin is metabolized mainly by [CYP2C9](#) and not extensively metabolized; approximately 10% is recovered as [metabolite](#). It is excreted in [feces](#) (90%) primarily and the [elimination half-life](#) is approximately 19 h.<sup>[13]</sup>

## Indications and regulation[edit]

---

Rosuvastatin is approved for the treatment of high [LDL cholesterol \(dyslipidemia\)](#), total cholesterol ([hypercholesterolemia](#)), and/or [triglycerides \(hypertriglyceridemia\)](#).<sup>[14]</sup> In February 2010, rosuvastatin was approved by the FDA for the primary prevention of cardiovascular events.<sup>[15]</sup>

As of 2004, rosuvastatin had been approved in 154 countries and launched in 56. Approval in the United States by the [FDA](#) came on August 12, 2003.<sup>[16]</sup>

The results of the [JUPITER trial](#) (2008) suggested rosuvastatin may decrease the [relative risk of heart attack](#) and [stroke](#) in patients without [hyperlipidemia](#), but with elevated levels of [highly sensitive C-reactive protein](#). This could strongly impact medical practice by placing many patients on statin [prophylaxis](#) who otherwise would have been untreated.<sup>[17][18]</sup> As a result of this clinical trial, the FDA approved rosuvastatin for the primary prevention of cardiovascular events.<sup>[15]</sup>

The [AURORA trial](#) randomized 2776 patients undergoing hemodialysis due to kidney damage to receive either rosuvastatin or placebo. The randomized, double-blind study (2005 to 2009) found no difference in the two groups in the primary end-point, a combination of cardiovascular mortality, nonfatal myocardial infarction, or nonfatal stroke. The study found no difference in all-cause mortality among this population at a mean follow-up of 3.8 years.<sup>[19]</sup>

## Effects on cholesterol levels[edit]

The effects of rosuvastatin on LDL cholesterol are dose-related. Rosuvastatin 10 to 40 mg was more efficacious in improving the lipid profile of patients with hypercholesterolemia than milligram-equivalent doses of atorvastatin and milligram-equivalent or higher doses of simvastatin and pravastatin.<sup>[20]</sup>

Meta-analysis showed that rosuvastatin treatment (5 or 10 mg) is able to modestly increase levels of [HDL cholesterol](#) as well, as with other statins.<sup>[21]</sup> A study in Japanese diabetics showed the low dose (2.5 mg) can also improve HDL levels.<sup>[22]</sup> A 2014 Cochrane review determined there was good evidence for rosuvastatin lowering non-HDL levels linearly with dose.<sup>[23]</sup> HDL increases by 7% with no dose effect noted.

## FDA advisory for East Asian patients[edit]

According to the FDA, the risk of myopathy during rosuvastatin therapy may be increased in Asian Americans:

Because Asians appear to process the drug differently, half the standard dose can have the same cholesterol-lowering benefit in those patients, though a full dose could increase the risk of side-effects, a study by the drug's manufacturer, AstraZeneca, indicated.<sup>[24]</sup>

Therefore, physicians should start Asian-American or East Asian patients at the lowest dose level.<sup>[25]</sup>

## Marketing and competition[edit]

### Patent protection[edit]

The main patent protecting rosuvastatin (RE37,314 - due to expire in 2016) was challenged as being an improper reissue of an earlier patent. This challenge was rejected in 2010, confirming protection until 2016.<sup>[26][27][28][29]</sup>

### Marketing[edit]

The drug was billed as a "super-statin" during its clinical development; the claim was that it offers high potency and improved cholesterol reduction compared to rivals in the class. The main competitors to rosuvastatin are [atorvastatin](#) (Lipitor) and [simvastatin](#) (Zocor). However, people can also combine [ezetimibe](#) with either rosuvastatin or atorvastatin and other agents on their own, for somewhat similar augmented response rates. So far, some published information for comparing rosuvastatin, atorvastatin, and ezetimibe/simvastatin results is available, but many of the relevant studies are still in progress.<sup>[10]</sup>

First launched in 2003, sales of rosuvastatin were \$129 million and \$908 million in 2003 and 2004, respectively, with a total patient treatment population of over 4 million by the end of 2004.<sup>[citation needed]</sup> Typical per patient costs to the UK NHS are £18.03-26.02/month (compared to £0.85-1.37/month for [simvastatin](#)).

### Debate and criticisms[edit]

In October 2003, several months after its introduction in [Europe](#), [Richard Horton](#), the editor of the [medical journal The Lancet](#), criticized the way Crestor had been introduced. "AstraZeneca's tactics in marketing its cholesterol-lowering drug, rosuvastatin, raise disturbing questions about how drugs enter clinical practice and what measures exist to protect patients from inadequately investigated medicines," according to his editorial. *The Lancet's* editorial position is that the data for Crestor's superiority rely too much on extrapolation from the lipid profile data (surrogate end-points) and too little on hard clinical end-points, which are available for other statins that had been on the market longer. The manufacturer responded by stating that few drugs had been tested so successfully on so many patients. In correspondence published in *The Lancet*, AstraZeneca's CEO [Sir Tom McKillop](#) called the editorial "flawed and incorrect" and slammed the journal for making "such an outrageous critique of a serious, well-studied medicine."<sup>[30]</sup>

In 2004, the consumer interest organization [Public Citizen](#) filed a [Citizen's Petition](#) with the FDA, asking that Crestor be withdrawn from the US market. On March 11, 2005, the FDA issued a

letter to Sidney M. Wolfe, M.D. of Public Citizen both denying the petition and providing an extensive detailed analysis of findings that demonstrated no basis for concerns about rosuvastatin compared with the other statins approved for marketing in the United States.<sup>[31]</sup>

## Myopathy[edit]

As with all statins, there is a concern of [rhabdomyolysis](#), a severe undesired side effect. The FDA has indicated that "it does not appear that the risk [of rhabdomyolysis] is greater with Crestor than with other marketed statins", but has mandated that a warning about this side-effect, as well as a kidney toxicity warning, be added to the product label.<sup>[9]</sup>

## Diabetes mellitus[edit]

[Statins](#) increase the risk of diabetes,<sup>[32]</sup> consistent with FDA's review of the [JUPITER trial](#), which reported a 27% increase in investigator-reported diabetes mellitus in rosuvastatin-treated patients compared to placebo-treated patients.<sup>[33]</sup>
