

Normylin:

Normylin is a Fixed Dose Combination of Pregabalin 75mg and Nortriptyline 10mg

Pregabalin, is a medication used to treat epilepsy, neuropathic pain, fibromyalgia, restless leg syndrome, and generalized anxiety disorder. Its use in epilepsy is as an add-on therapy for partial seizures. When used before surgery, it reduces pain but results in greater sedation and visual disturbances. It is taken by mouth.

Pregabalin was approved for medical use in the United States in 2004. It was developed as a successor to gabapentin. It is available as a generic medication in a number of countries, including the United States as of 2019. In the US the wholesale costs is about US\$450 per month as of July 2019. It was the 83rd most prescribed medication in the United States with more than 9 million prescriptions.

Nortriptyline is a medication used to treat depression, neuropathic pain, attention deficit hyperactivity disorder (ADHD), stopping smoking and anxiety. It does not appear to be useful for young people with depression. Nortriptyline is a less preferred treatment for ADHD and stopping smoking. It is taken by mouth.

Common side effects include dry mouth, constipation, blurry vision, sleepiness, low blood pressure with standing, and weakness.^[3] Serious side effects may include seizures, an increased risk of suicide in those less than 25 years of age, urinary retention, glaucoma, mania, and a number of heart issues. Nortriptyline may cause problems if taken during pregnancy. Use during breast feeding appears to be relatively safe. It is a tricyclic antidepressant (TCA) and is believed to work by altering levels of serotonin and norepinephrine.

Nortriptyline was approved for medical use in the United States in 1964. It is available as a generic medication. It was the 192nd most prescribed medication in the United States, with more than 3.1 million prescriptions.
